

Network Control Solution

Company Snapshot

Unispeed A/S was established in 1999 and has rapidly become a market leader in Network Packet Sniffing and Analysis. The essence of our work is IT security, speed, scalability, reliability and user friendliness - all these features and values are built into our products

Unispeed A/S has developed solutions to handle the tough requirements of the busiest networks in the world. Some of the worlds leading internet players already use and benefit from our products.

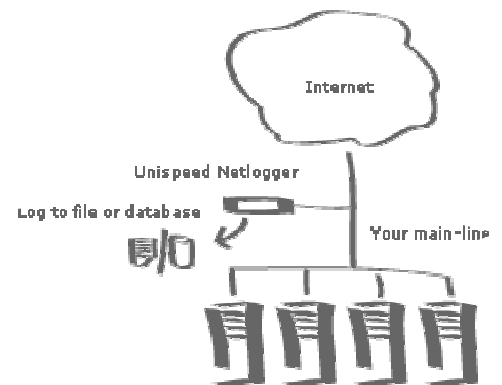

Unispeed A/S has earned a reputation of producing high quality equipment for interception and collection of data for network analysis, server performance and data logging for fast and secure data recovery - providing the highest level of network integrity and stability.

System Overview

Unispeed Network control Solution gives you precise information of the traffic composition and load distribution on your network. Without installing a single piece of software onto your web servers you will be able to enhance the performance and availability of your network and resources by analyzing traffic patterns and server behavior - either in real-time, or from recorded data. This will allow you to identify bottlenecks in the network topology, as well as faulty or overloaded equipment.

Unispeed Netlogger resides on a single point on your network, from where it monitors the traffic flow across your entire network, as well as collects and analyses information about:

- Traffic distribution to individual servers
- Measures latency and response patterns to each server, and even detects if a server is not responding timely
- Measures packet loss and retransmissions, and examines corrupted packets
- Preserves data to and from the entire network for easy and reliable data mining and network review
- Stores all your data in a single server log file for safe data recovery
- Alerts maintenance functions if server or network response time exceeds desired limits (SMS or E-mail)

Unispeed Netlogger offers costumers the following unique features compared to other methods

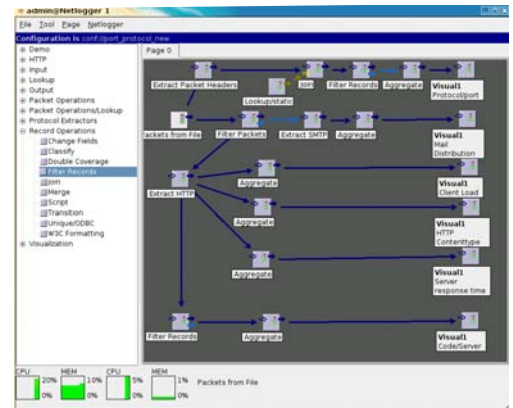

- No installation on servers or integration with existing software necessary secures trouble free network performance
- Takes off load from servers up to 20% on NT, 15% on Apache, thereby improving network speed significantly
- Increased network speed by optimising load distribution to each server
- Centralized logging of data even for the largest networks, enables improved data recovery in case of network or hardware failure
- Centralized analysis in real time from several servers and data centres
- Customised visualisation or platform for any visualization tool

Real-Time visualisation of your network

Powerful Graphical Interface

The Netlogger Workbench is a powerful graphical interface, and with a few clicks you can analyse and aggregate any aspect of your network

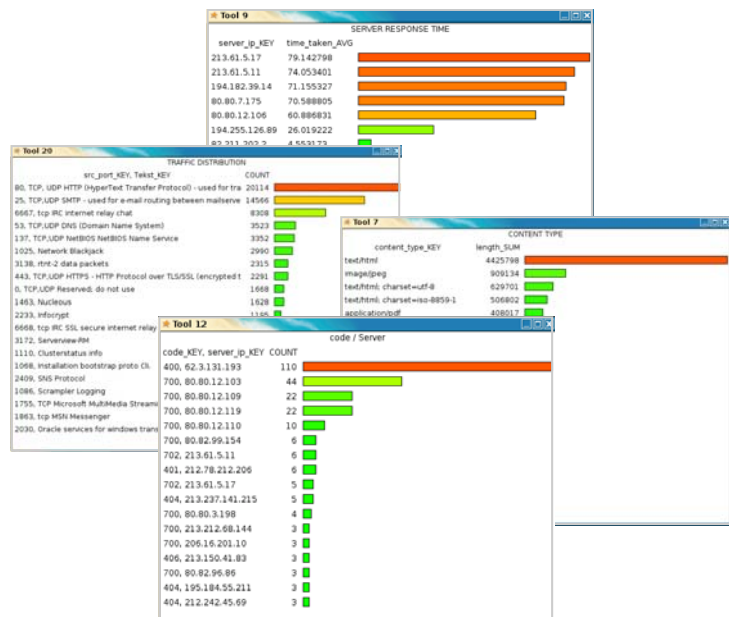

- Monitor overall network performance and individual servers
- Understand resource usage and identify unwanted trends
- Determine the volume of traffic of individual types
- Monitor QOS from your customers point of view

Real-Time Visualisation

Real-Time visualization from aggregated data provides you the clear network visibility needed for quick decision making

With the Netlogger - you are in possession of the full flexibility to create the views suited for you network.
